

ZONKE SYSTEM

DEVELOPER REQUIREMENTS & SYSTEM FLOW

Simple guide for the web developer

1. Purpose

This document explains how the Zonke system should work for two main user types: Clients and Freelancers / Service Providers. It is written as a simple guide for the web developer so that the required user journey and system functions are clear.

2. Two Main User Types

User	Main Purpose
Client	Creates and posts jobs/documents, receives freelancer responses and manages the job.
Freelancer / Service Provider	Creates an account, searches for jobs, views/downloads job information, responds to jobs and posts completed work.

3. CLIENT — Create Account

The client must be able to create an account using:

Company logo / picture

Company name

Contact details

Username

Password

After entering the required information, the client selects Create Account.

4. CLIENT — Sign In

The client signs in using:

Username

Password

After successful login, the client is taken to the Client Account / Client Dashboard.

5. CLIENT — Account / Dashboard

The client dashboard should allow the client to:

Post a job or document.

Add a job description.

View responses received from freelancers.

See the number of responses, for example: 5 responses from 5 freelancers.

Open and review each freelancer response.

Continue communication with the relevant freelancer.

6. CLIENT — Post Job / Document

When posting a job, the client should be able to provide:

Job / document

Job description

Any required supporting information or files

After the job is posted, it should become available for freelancers to search and view according to the system's access rules.

7. FREELANCER — Create Account

The freelancer must be able to create an account using:

Name

Contact details
Logo / profile picture
Username
Password

After entering the required information, the freelancer selects Create Account.

8. FREELANCER — Sign In

The freelancer signs in using:

Username
Password

After successful login, the freelancer is taken to the Freelancer Account / Freelancer Dashboard.

9. FREELANCER — Account / Dashboard

The freelancer dashboard should allow the freelancer to:

Search for available jobs.
Open and view job information.
Download the job/document where downloading is available.
Respond / apply for a job.
Post or upload completed work.
View responses or communication from clients.

10. MAIN SYSTEM FLOW

Client creates account → Client logs in → Client posts job/document → Freelancers search jobs → Freelancer opens job → Freelancer views/downloads job → Freelancer responds → Client receives response → Client views freelancer responses → Client and freelancer continue communication → Freelancer completes work → Freelancer posts completed work → Client views completed work.

11. How Client and Freelancer Accounts Connect

The job is the main connection between the client and freelancer. When a freelancer responds to a job, the response must be connected to that specific job and freelancer. The client must then be able to see the response from the correct freelancer.

12. Response Flow

Step	System Action
1	Client posts a job.
2	System stores the job.
3	Job becomes available to relevant freelancers.
4	Freelancer finds and opens the job.
5	Freelancer views/downloads the job information.
6	Freelancer responds to the job.
7	System links the response to the correct job and freelancer.

8	Client sees the response in the job's response section.
9	Client opens and reviews the freelancer response.
10	Client and freelancer continue the agreed work process.

13. Completed Work Flow

Once the freelancer has completed the work, the freelancer should be able to post or upload the completed work from the relevant job. The completed work must remain linked to that job so the client can open the same job and view the submitted work.

Flow: Freelancer completes work → Posts/uploads completed work → System links it to the job → Client views completed work.

14. Communication Board

The system should provide a communication area between the client and service provider/freelancer for the relevant job. The communication should remain linked to the job so both parties know which job the conversation is about.

Client can communicate with the relevant freelancer.

Freelancer can communicate with the relevant client.

The conversation is connected to the relevant job.

The communication area should be accessible from the relevant job/account.

15. Basic Screens Required

User	Screen
Both	Create Account
Both	Login
Client	Client Dashboard
Client	Post Job / Document
Client	Job Details
Client	Job Responses
Client	Freelancer Response Details
Client	Communication Board
Freelancer	Freelancer Dashboard

Freelancer	Search Jobs
Freelancer	Job Details / Download
Freelancer	Respond / Apply
Freelancer	Completed Work Upload
Freelancer	Communication Board

16. Important Developer Rules

Clients and freelancers must have separate account roles.

A user must only access the account associated with their own login.

A client should only manage jobs belonging to that client account.

A freelancer's response must be connected to the correct job.

The client must be able to see which freelancer submitted each response.

Completed work must be connected to the correct job.

Communication must be linked to the relevant job.

The system should clearly show the status of the job and its responses.

Keep the user journey simple and easy to understand.

Do not add complicated functions that are not part of the agreed requirements.

17. Simple End-to-End Example

A company creates a Client account and posts a job with a description and document. Five freelancers find the job and respond. The client's dashboard shows '5 Responses from 5 Freelancers'. The client opens the responses and communicates with the relevant freelancer. The freelancer completes the work and uploads/posts the completed work through the same job. The client opens that job and views the completed work.

18. Final System Structure

CLIENT	FREELANCER / SERVICE PROVIDER
Create account	Create account
Login	Login
Client dashboard	Freelancer dashboard
Post job/document	Search jobs
Add job description	View/download job
Receive responses	Respond/apply
View freelancer responses	Post completed work

Continue communication	View client responses
View completed work	Complete work

19. Final Developer Understanding

The Zonke system connects clients with freelancers/service providers through jobs. The client creates and posts a job. Freelancers search for available jobs, open the job information and respond. The system sends those responses back to the client and keeps each response connected to the correct job. Once the client and freelancer proceed with the work, the freelancer can submit completed work through the same job. The client can then view the completed work. The communication board allows the client and freelancer to communicate about the relevant job.
